

## **FOLDERS** for SharePoint

**MetaVis FOLDERS** is a small, behind-the-scenes SharePoint control that automatically assigns values for document columns based on the folder path where this document is created. MetaVis Folders collects field values from the folder chain this item is created in and then applies these values to the document itself. Lists and folders could be configured to support this functionality using familiar SharePoint interface.

**MetaVis FOLDERS** enables users to:

- Collect more metadata about documents without increasing work for content authors. Authors will populate just few field values during document submission and SharePoint will automatically populate the rest of them.
  - Migrate files from file system or other SharePoint site to SharePoint libraries and assign metadata at the same time while using familiar drag and drop or copy and paste Windows Explorer interface to SharePoint
- *Copy column values from each folder in the folder path of the item into item columns at the time of item creation*
  - *Give priority to the column values entered by the user*
  - *Allow nested folders to overwrite column values defined for the parent folders*
  - *Enable auto-assignment for specific lists, document libraries and folders*
  - *Exclude specific folders from MetaVis Folders functionality*
